For advanced undergraduate and beginning graduate students in atmospheric, oceanic, and climate science, Atmosphere, Ocean and Climate Dynamics is an introductory textbook on the circulations of the atmosphere and ocean and their interaction, with an emphasis on global scales. It will give students a good grasp of what the atmosphere and oceans look like on the large-scale and why they look that way. The role of the oceans in climate and paleoclimate is also discussed. The combination of observations, theory and accompanying illustrative laboratory experiments sets this text apart by making it accessible to students with no prior training in meteorology or oceanography. * Written at a mathematical level that is appealing for undergraduates and beginning graduate students * Provides a useful educational tool through a combination of observations and laboratory

demonstrations which can be viewed over the web * Contains instructions on how to reproduce the simple but informative laboratory experiments * Includes copious problems (with sample answers) to help students learn the material.

The only screenwriting book that includes a DVD that contains performances of the short films and screenplays that are featured in the book! The beauty and power of any story lies in its ability to connect to the reader, listener, or observer. Crafting Short Screenplays That Connect is the first screenwriting guide to introduce connection as an essential, although essentially overlooked, aspect of creating stories for the screen and of the screenwriting process itself. Written with clarity and humor, this book teaches the craft of writing short screenplays by guiding the student through carefully focused writing exercises of increasing length and complexity. Eight award-winning student screenplays are included for illustration and inspiration. The text is divided into three parts. Part one focuses on preparing to write by means of exercises designed to help students think more deeply about the screenwriter's purposes; their own unique vision, material and process; and finally about what screenplays are at their simplest and most profound level--a pattern of human change, created from specific moments of change--discoveries and decisions. Part two teaches students how to craft an effective pattern of human change. It guides them through the writing and re-writing of "Five (Not So

Easy) Pieces"--five short screenplays of increasing length and complexity--focusing on a specific principle of dramatic technique: The Discovery, The Decision, The Boxing Match, The Improbable Connection, and The Long Short Screenplay. Part Three presents the five screenplays used throughout the book to illustrate the dramatic principles that have been discussed, and includes interviews with the screenwriters, a look at where they are now and what they are doing, and brief discussion of how each film evolved.

A History of Modern Psychology, 5th Edition

Dear Prospective Examinee: Welcome to the exciting world of Customs! Customs Broker is a licensed profession. Passing the Customs Broker Examination is a prerequisite for individual's Customs Broker license. Passing is not easy, and many exam takers do not pass. The primary challenge lies not in the difficulty of questions themselves, but in the amount of time customs examiners allocate to examinees. My interaction with students with little or no customs experience shows that everyone is able to understand some of the most difficult questions. This means it is not the difficulty of questions, but rather the amount of time provided, which leads many not to pass. The problem, therefore, lies in time management! Fortunately, this can be corrected. But such correction requires dedication and practice. Many questions you will see on exam are similar to those questions asked in previous exams. Some are even identical. Examinee who sees a

familiar question on the exam is likely to spend less time to answering it. This means more time being left to answer more difficult and less familiar questions, resulting in a greater likelihood of success. Exercise Book is designed to do just that: to help examinees pass the Customs Broker Exam. The approach is very simple. We take the very questions that examiners have asked before, and provide rationale for their answers. The rationale - or reasoning - cause examinees to revisit topics tested while providing the structure and organization. The structure helps to build a framework that can be applied to variety of questions. During the exam, even if examinee does not recall the structure, the familiarity with the question would help. Exercise Book consists of: Table of Contents; Table of Questions; Table of Topics; Approach to Answering Questions; Practice Exam Questions; and Practice Exam Answers. Exercise Book is supplemented with video discussions and supplemental reading on the internet, through Web Supplements at LawCustoms.com/eb.

The second edition of this book on lipids, lipoprotein and membrane biochemistry has two major objectives - to provide an advanced textbook for students in these areas of biochemistry, and to summarise the field for scientists pursuing research in these and related fields. Since the first edition of this book was published in 1985 the emphasis on research in the area of lipid and membrane biochemistry

has evolved in new directions. Consequently, the second edition has been modified to include four chapters on lipoproteins. Moreover, the other chapters have been extensively updated and revised so that additional material covering the areas of cell signalling by lipids, the assembly of lipids and proteins into membranes, and the increasing use of molecular biological techniques for research in the areas of lipid, lipoprotein and membrane biochemistry have been included. Each chapter of the textbook is written by an expert in the field, but the chapters are not simply reviews of current literature. Rather, they are written as current, readable summaries of these areas of research which should be readily understandable to students and researchers who have a basic knowledge of general biochemistry. The authors were selected for their abilities both as researchers and as communicators. In addition, the editors have carefully coordinated the chapters so that there is little overlap, yet extensive cross-referencing among chapters.

A Practical Guide to Physical and Chemical Principles and Calculations for Today's Process Control Operators In Basic Principles and Calculations in Process Technology, author T. David Griffith walks process technologists through the basic principles that govern their operations, helping them collaborate with chemical engineers to improve both safety and productivity. He shows process operators how to go beyond memorizing rules and formulas to understand the underlying science and physical laws, so they can accurately interpret anomalies and respond appropriately when exact rules or calculation methods don't exist. Using simple algebra and non-technical analogies, Griffith explains each idea and technique without calculus. He introduces each topic by explaining why it matters to process technologists and offers numerous examples that show how key principles are applied and calculations are performed. For end-of-chapter problems, he provides

the solutions in plain-English discussions of how and why they work. Chapter appendixes provide more advanced information for further exploration. Basic Principles and Calculations in Process Technology is an indispensable, practical resource for every process technologist who wants to know "what the numbers mean" so they can control their systems and processes more efficiently, safely, and reliably. T. David Griffith received his B.S. in chemical engineering from The University of Texas at Austin and his Ph.D. from the University of Wisconsin-Madison, then top-ranked in the discipline. After working in research on enhanced oil recovery (EOR), he cofounded a small chemical company, and later in his career he developed a record-setting Electronic Data Interchange (EDI) software package. He currently instructs in the hydrocarbon processing industry. Coverage includes • Preparing to solve problems by carefully organizing them and establishing consistent sets of measures • Calculating areas and volumes, including complex objects and interpolation • Understanding Boyle's Law, Charles's Law, and the Ideal Gas Law • Predicting the behavior of gases under extreme conditions • Applying thermodynamic laws to calculate work and changes in gas enthalpy, and to recognize operational problems • Explaining phase equilibria for distillation and fractionalization • Estimating chemical reaction speed to optimize control • Balancing material or energy as they cross system boundaries • Using material balance calculations to confirm quality control and prevent major problems • Calculating energy balances and using them to troubleshoot poor throughput • Understanding fluid flow, including shear, viscosity, laminar and turbulent flows,

vectors, and tensors • Characterizing the operation of devices that transport heat energy for heating or cooling • Analyzing mass transfer in separation processes for materials purification
