Qualitative Research

Endoscopy is a fast moving field, and new techniques are continuously emerging. In recent decades, endoscopy has evolved and branched out from a diagnostic modality to enhanced video and computer assisting imaging with impressive interventional capabilities. The modern endoscopy has seen advances not only in types of endoscopes available, but also in types of interventions amenable to the endoscopic approach. To date, there are a lot more developments that are being trialed. Modern endoscopic equipment provides physicians with the benefit of many technical advances. Endoscopy is an effective and safe procedure even in special

populations including pediatric patients and renal transplant patients. It serves as the tool for diagnosis and therapeutic interventions of many organs including gastrointestinal tract, head and neck, urinary tract and others.

The good news is that early detection has significantly improved overall survival rates and continues to do so. A number of prevention strategies contribute to this positive trend, and today a patient who undergoes a colonoscopy for screening purposes stands a much better chance of being effectively surveyed for prevention of colorectal cancer. Patients can rely increasingly on the improved datasets and technical advances that are being made in screening approaches and skills. With continued progress, particularly in the partnership between clinicians and computer scientists, the future for colorectal cancer surveillance looks increasingly positive for the development of improved tools and methods.
